summary

Cloud architect with 21 years in IT, the last ten designing and running platforms for Swedish retailers, technology companies and a national betting operator. Deepest on AWS: multi-account organisations, hybrid networking, delivery platforms and access design, with cost and reliability built into the platform decisions. I lead AWS platform work and mentor engineers. I also run GCP and Azure where the client's estate needs them.

skills

AWS AWS Organizations Terraform Amazon ECS Kubernetes (EKS) Lambda / Serverless GitHub Actions GitLab CI GitOps IaC Hybrid Networking IAM / OIDC SSO / RBAC Secrets Management WAF KMS CloudWatch Grafana / Prometheus OpenTelemetry Elastic Cloud PostgreSQL (RDS) FinOps ISO 27001 / SOC 2 GDPR MCP / AI agent tooling GCP Azure Python Go

work experience

Senior Cloud Architect · Consultant

Nov 2024 – Present

[Gina Tricot](#) — Stockholm

Leads AWS architecture and delivery for an established Nordic fashion retailer; also owns the Azure Terraform pipelines and the GCP infrastructure for a new product line.

- Proposed and delivered the move of production deploys from AWS CodePipeline to GitHub Actions with ECS-native blue/green across **15 services**: no downtime on cutover, one approval gate per release, OIDC trust scoped to production.
- Set the Terraform standard for the estate: state layout, provider upgrades, module consolidation, plan-on-PR and apply-on-merge on GitHub Actions and Azure DevOps (with Checkov), and **8** architecture diagrams regenerated from Terraform as the source of truth.
- Ran **3** architecture assessments for the business (low-code hosting POC against the existing backend, feature-flag SaaS versus IaC configuration, Cloud Run direct versus load balancer with Cloud Armor), each with a written recommendation.
- Designed the data-handling model for an internal AI-agent plugin marketplace (Claude Code, Copilot): MCP log search over Elastic Cloud behind field-level-security keys, verified against production so personal data cannot be read through that path.
- AI-assisted RDS analytics workflow on GitHub Actions that traces top Performance Insights SQL back to ORM source and writes prioritised query and index recommendations.
- Removed standing access: every pipeline on OIDC-federated roles, SSH bastions replaced by AWS SSM, ECS SSH by ECS Exec.
- Cut AWS spend **15–20%** by right-sizing containers, EC2 and RDS and moving non-critical workloads to Spot; step and predictive autoscaling for business-critical ECS services.

Senior Cloud Architect · Consultant

Nov 2023 – Sep 2024

Validio — Stockholm

Platform engineering for a data observability scale-up, mid-Series A, running on AWS, GCP and Azure.

- › Infrastructure controls for SOC 2 Type II and ISO 27001 in Vanta: control enforcement, vulnerability remediation, and the evidence auditors accept.
- › Logs and metrics from GCP, AWS (CloudWatch) and Azure centralised through a BindPlane OTEL server on GCP; one place to look instead of three.
- › Unified Terraform modules across AWS, GCP and Azure so product teams get environments on demand; new services onboarded in hours rather than days.
- › Reworked GitLab CI/CD for application releases and Terraform. Deploys got faster and pipelines broke less often.
- › GCP metrics exporter to BigQuery in Python. Cloud Function on Cloud Scheduler, wired into GCP monitoring.
- › AlexisHR as source of truth for users via Google Workspace; onboarding automated through GitLab pipelines.

Senior Cloud Architect · Consultant

Jun 2019 – Oct 2023

AB Trav och Galopp (ATG) — Stockholm

Platform team responsible for AWS, GitHub and Terraform at a national betting operator; mentored engineers in AWS and advised developer teams on DevOps.

- › AWS Organization of **40+ accounts**, all in Terraform, with one modular standard for the whole estate; engineer onboarding starts in Entra ID and syncs into the Organization.
- › Cut infrastructure spend **30%** with Spot, Lambda, billing alerts and drift detection; Cost Intelligence dashboards on Athena, Glue, Kinesis and QuickSight.
- › Hybrid network on DirectConnect, VPCs, Transit Gateways and IPsec VPN. **78% lower** data-transfer cost, **63% lower** latency.
- › GitHub Organization in Terraform; CI/CD moved to GitHub Actions. **20%** developer productivity lift.
- › OPA policy for Terraform and GitHub Actions; non-compliant changes fail in the PR, not in production.
- › Doppler-based central secrets platform. **60% less** time spent on secrets management.
- › OIDC federated AWS access from cloud and on-prem; static credentials sharply reduced.
- › Grafana/Prometheus on EKS via Helm with custom exporters and OpenTelemetry; Grafana managed as code with Grafonnet and Terraform.

Reliability Engineer · Consultant

May 2018 – May 2019

Klarna — Stockholm

- › Moved AWS infrastructure to Terraform, with plan and apply running from the pipeline rather than from engineer laptops.
- › Jenkins + Groovy delivery pipelines for build, test and deploy of production services.
- › Automated Kubernetes deployments, including Oracle Database; monitoring with Prometheus, Grafana, CloudWatch and Datadog.

Infrastructure Operations Engineer

Sep 2016 – May 2018

Accedo — Stockholm

- › Built and operated AWS infrastructure for production services in close collaboration with dev and QA teams.
- › Established Terraform as the IaC backbone and introduced integration tests for infra code with TestKitchen and InSpec.
- › Ran internal services for monitoring (Datadog), metrics (Logstash), logging (Elasticsearch), config (Chef) and CI (Jenkins).
- › On-call rotation — troubleshoot and resolved critical infrastructure issues to keep availability high.

SysOps Engineer · System Administrator

Jul 2013 – Sep 2016

Viaplay — Stockholm

- › Built IaC with AWS CloudFormation and Troposphere; introduced Jenkins continuous delivery to AWS.
- › Operated a large-scale Zabbix monitoring cluster across **multi-petabyte** environments; added Grafana dashboards.
- › Built a Lustre/Pacemaker HA file cluster for redundant, reliable storage of critical data.
- › Wrote advanced Bash automation for a multi-petabyte archive, sharply improving throughput on massive datasets.

System Administrator

Dec 2011 – Jul 2013

[Assign Me AB](#) — Stockholm

- › Redundant XEN system with manual failover for SYVAB; kept critical municipal infrastructure stable.
- › Zabbix monitoring for XEN environments; caught health issues before they paged.
- › Jenkins as a distributed task scheduler, taking load off manual scheduling.
- › Migrated LAMP to Nginx, cutting response times; deployed an LNMP warm-backup server for business continuity.

SysAdmin Tech Lead

May 2005 – Oct 2010

[NIX Solutions](#) — Kharkiv

- › Architected high-load infrastructure for **millions of users** — large web clusters on AWS and Rackspace Cloud, with virtualization on XEN/VMware/OpenVZ.
- › Led HA and load-balancing for global services with HAProxy, LVS and Keepalived.
- › Built custom Linux-based solutions, including a custom Linux live CD and Linux-based internet gateways tailored to project needs.
- › Led a **13-person** sysadmin team; mentored new hires and existing team members.
